Individual Undergraduate Project

Project Interim Report

**A Game-Based Approach to Motor Imagery
Adaptation and BCI Calibration**

Student Name: Cao Đăng Khoa

Student ID: 25195675

Course: Bachelor of Science with Honours Computer Science

Supervisor: Dr. Vi Chí Thành

Date: December 1, 2025

List of Tables

1.0 Introduction and Context

This section introduces your project. It should be brief yet engaging, capturing the reader's interest and highlighting the significance of your work.

Begin broadly by introducing the subject and its main discipline, such as cybersecurity, sustainable engineering, or healthcare analytics. Provide an overview of the background and current situation, offering enough context so a reader unfamiliar with the field can understand its significance. Why is this area of modern relevance?

Note: Remember to use in-text citations for statements that support your core arguments. This applies to all sections throughout your project report.

1.1 Problem Statement

Clearly and specifically state the problem your project is designed to address. This should be a concise statement that identifies the key issue. Think of it as the "what" and "why" of your project, all in one or two sentences. For example: "Small to medium-sized enterprises (SMEs) lack affordable and scalable cybersecurity solutions, leaving them highly susceptible to data breaches."

2.0 Review of Existing Knowledge

Comprehensively outline and expand on the primary concepts and established models presented in studies relevant to your problem statement. What is the existing knowledge on this subject? What are the main findings and conclusions derived from these studies? This should not merely be a descriptive summary; rather, a critical analysis of the information to construct a coherent narrative regarding the current state of knowledge.

Note: The review of concepts could be broken down into further sub-sections depending on the themes relevant to your topic that you identify during the review.

2.1 Critical Analysis and Gap Identification

During this phase, you carry out a critical reflection of the sources you have examined, identifying their limitations, contradictions, or disagreements within the literature. Establish which questions remain unanswered. This critical scrutiny should help you pinpoint a specific "gap"; whether it is an unresolved issue, an underexplored area, a new perspective that has not been considered, or a practical solution that is missing from existing studies.

2.2 Project Justification

Motor imagery-based BCIs are among the most commonly studied paradigms due to their non-invasive nature and potential for rehabilitation applications.

3.0 Project Aims, Objectives, and Scope

This section clearly defines what your project intends to achieve (aims), the specific steps you will take to reach those goals (objectives), and the boundaries within which your project will operate (scope).

3.1 Project Aims

The primary aim of this project is to develop a game-based motor imagery BCI system that can adapt to individual users, thereby enhancing calibration efficiency and overall user experience.

3.2 Project Objectives

To achieve the stated aim, the project will pursue the following objectives:

3.3 Project Scope
